⑤⑦ Novel peptides are provided having substantially the same sequence as immunologically significant fragments of AIDS-related viruses. The polypeptides can be used as reagents in the determination of exposure of a human host to the virus. Of particular interest is the use of polypeptides in screening blood products.

Description**SYNTHETIC ANTIGEN FOR THE DETECTION OF AIDS-RELATED DISEASE****BACKGROUND OF THE INVENTION****Field of the Invention**

With the discovery that the diseases called lymphadenopathy syndrome and acquired immune deficiency disease (AIDS) are caused by an infectious retrovirus designated lymphadenopathy virus (LAV), human T-cell lymphotropic virus-III (HTLV-III), AIDS-related virus (ARV), or immune deficiency-associated virus (IDAV), there has become an immediate need to be able to detect potential vectors of the disease, such as blood from diseased individuals, which may be employed for transfusions or from which specific blood factors may be isolated.

To detect potential vectors of the disease, it is necessary to have viral proteins and/or antibodies to such proteins. Because of the hazards associated with growing the LAV/HTLV-III retrovirus, there is significant interest in establishing means for obtaining the viral proteins or their immunologic equivalents, which means do not necessitate handling large volumes of live, potentially infectious virus. In choosing alternatives, one must be concerned with the fact that the viruses have been reported to be highly polymorphic, frequently changing as the retrovirus is passaged.

Brief Description of the Relevant Literature

The various antigens of the retrovirus are described by Saxinger et al., *Science* (1985) 227:1036-1038. See also Gallo et al., *ibid.* (1984) 224:500; Sarangadharan et al., *ibid.* 224:506; Barre-Sinoussi et al., *ibid.* (1983) 220:868; Montagnier et al., in *Human T-Cell Leukemia/Lymphoma Virus*, Gallo, Essex, Gross, eds. (Cold Spring Harbor Laboratory, Cold Spring Harbor, New York), 1984, p. 363. These may include, but are not limited to, p13, p18, p25, p36, gp43, p55, gp65, gp110, etc., where the numbers may differ depending upon the reporter.

Hopp and Woods, *Proc. Natl. Acad. Sci. USA* (1981) 78:3824, described criteria for selecting peptides as potential epitopes of polypeptides based on their relative hydrophilicity. In one study employing these criteria, a 12-amino acid peptide was synthesized that bound 90% of antibodies elicited by the native protein (Hopp, *Molec. Immunol.* (1981) 18:869). In general, Hopp/Woods criteria have been shown not to have a high predictive value. Furthermore, epitopes have been demonstrated which are not hydrophilic (Kazim et al., *Biochem. J.* (1982) 203:201). Other studies of polypeptide antigenicity include Green et al., *Cell* (1982) 28:477, where peptides were employed which elicited antibodies, which antibodies were capable of binding to the native protein, while conversely antibodies which were elicited by the native protein failed to bind the peptides, and Trainer et al., *Nature* (1984) 312:127, whose results with myohaemerythrin paralleled those of Green et al.

The complete nucleotide sequence of LAV is reported by Wain-Hobson et al., *Cell* (1985) 40:9. The complete sequence for HTLV-III is reported by Muesing et al., *Nature* (1985) 313:450, while the complete sequence for ARV is reported by Sanchez-Pescadore et al., *Science* (1985) 227:484. All three viruses exhibit substantial nucleotide homology and are similar with respect to morphology, cytopathology, requirements for optimum reverse transcriptase activity, and at least some antigenic properties (Levy et al., *Science* (1984) 225:840; Shupbach et al., *Science* (1984) 224:503), and hence should be considered isolates of the same virus. See also, Chang et al., *Science* (1985) 228:93. Based on these and other data the Human Retrovirus Subcommittee of the International Committee on the Taxonomy of Viruses has proposed the name Human Immuno-deficiency Virus (HIV) for this group of closely related viruses (*Science* (1986) 232:697). This designation will be used within this application.

SUMMARY OF THE INVENTION

Peptide sequences capable of immunologically mimicking proteins encoded in the *pbl* and *gag* regions of the HIV retrovirus are provided as reagents for use in the screening of blood and blood products for prior exposure to the retrovirus. The peptides are at least 5 amino acids in length and can be used in various specific binding assays for the detection of antibodies to HIV virus, for the detection of HIV antigens, or as immunogens.

DESCRIPTION OF THE SPECIFIC EMBODIMENTS

For the purpose of this disclosure, a virus is considered to be the same as or equivalent to HIV if it substantially fulfills the following criteria:

- (a) The virus is tropic for T-lymphocytes, especially T-helper cells (CD4+, according to the international nomenclature defined in Bernard et al., eds. *Leucocyte Typing*, New York: Springer Verlag, 1984);
- (b) The virus is cytopathic for infected CD4+ cells (rather than transforming, as are HTLV-I and -II);
- (c) The virus encodes an RNA-dependent DNA polymerase (reverse transcriptase) which is Mg²⁺-dependent (optimum concentration 5mM), has a pH optimum of 7.8, is not inhibitable by actinomycin D, and can employ oligo(dT)₁₂₋₁₈ as a primer for reverse transcription from its 3' LTR;
- (d) The virus bands in a sucrose gradient at a density of approximately 1.16;
- (e) The virus can be labeled with [³H]-uridine;

(f) The virus is substantially cross-reactive immunologically with the proteins encoded by the gag, env, and pol regions of HIV; and

(g) The virus shares substantial nucleotide homology (approximately 75-100%) and amino acid sequence homology (approximately 75-100%) with LAV or HTLV-III.

Novel peptides are provided which immunologically mimic proteins encoded by the HIV retrovirus, particularly proteins encoded by the pol region of the viral genome. To accommodate strain-to-strain variations among different isolates, adjustments for conservative substitutions, and selection among the alternatives where non-conservative substitutions are involved, may be made. These peptides can be used individually or together for detection of the virus or of antibodies to the virus in a physiological sample. Depending upon the nature of the test protocol, the peptides may be labeled or unlabeled, bound to a solid surface, conjugated to a carrier or other compounds, or the like.

The peptides of interest will be derived from the peptides encoded by the pol and gag regions. These peptides will be primarily derived from p31 of the pol region and from p25 of the gag region. These peptides will be given Roman numerals and will also be given numerical designations, which are arbitrarily associated with the manner in which they were produced, in this application. Of particular interest is the coding region extending from about base pair (bp) 4265 to bp 4519, particularly from about bp 4265 to bp 4399 and from bp 4385 to bp 4519, including a shorter segment from bp 4430 to bp 4519. Also, the coding region extending from about bp 897 to bp 986 is of particular interest. (Numbering according to Wain-Hobson *et al.*, *supra*.)

The peptides of interest will include at least 5, sometimes 6, sometimes 8, sometimes 12, usually fewer than about 50, more usually fewer than about 35, and preferably fewer than about 25 amino acids included within a sequence coded for by the HIV retrovirus. In each instance, desirably the oligopeptide will be as small as possible while still maintaining substantially all of the sensitivity of the larger peptide. In some instances it may be desirable to join two or more oligopeptides which are non-overlapping to form a single peptide structure or to use them as individual peptides at the same time, which separately or together provide equivalent sensitivity to the parent.

The peptide may be modified by introducing conservative or non-conservative substitutions in the peptides, usually fewer than 20 number percent, more usually fewer than 10 number percent of the amino acids being exchanged. In those situations where regions are found to be polymorphic, it may be desirable to vary one or more particular amino acids to more effectively mimic the differing epitopes of the different retroviral strains.

It should be understood that the polypeptides employed in the subject invention need not be identical to any particular HIV polypeptide sequence, so long as the subject compounds are able to provide for immunological competition with proteins of at least one of the strains of the HIV retrovirus. Therefore, the subject polypeptides may be subject to various changes, such as insertions, deletions, and substitutions, either conservative or non-conservative, where such changes might provide for certain advantages in their use. By conservative substitutions is intended substitutions within groups such as gly, ala; val, ile, leu; asp, glu; asn, gln; ser, thr; lys, arg; phe, tyr; and norleu, met. Usually, the sequence will not differ by more than 20% from the sequence of at least one strain of an HIV retrovirus except where additional amino acids may be added at either terminus for the purpose of providing an "arm" by which the peptides of this invention may be conveniently immobilized. The arms will usually be at least 1 amino acid and may be 50 or more amino acids, more often 1 to 10 amino acids, in length.

In addition, one or two amino acids may be added to the termini of an oligopeptide or peptide to provide for ease of linking of peptides one to another, for coupling to a support or larger peptide, for reasons to be discussed subsequently, for modifying the physical or chemical properties of the peptide or oligopeptide, or the like.

Amino acids such as tyrosine, cysteine, lysine, glutamic or aspartic acid, or the like may be introduced at the C- or N-terminus of the peptide or oligopeptide to provide for a useful functionality for linking. Cysteine is particularly preferred to facilitate covalent coupling to other peptides or to form polymers by oxidation. Combinations of cysteine with intervening amino acid spacers are also useful. For example, two cysteine residues can be separated by one or more α -amino acid residues having a single side chain containing no more than four carbon atoms (small size being desired to avoid interference with coupling reactions). Glycine residues are preferred for this reason, particularly one to three glycine residues between amino acids added to facilitate coupling. Cysteine residues are particularly useful in forming network polymers by oxidation. In such cases it is preferred to have at least three cysteine residues present in the molecules being linked, preferably by utilizing cysteine residues added to the terminal portions of the peptides.

In addition, the peptide or oligopeptide sequences may differ from the natural sequence by the sequence being modified by terminal -NH₂ acylation, e.g., acetylation, or thioglycolic acid amidation, terminal-carboxy amidation, e.g., with ammonia or methylamine, to provide sites for linking to a support or other molecule.

The peptides and oligopeptides of interest will now be considered. Peptide I (126) encoded in the region bp 4265 to bp 4399 will have the following amino acid sequence, where oligopeptides included within the following sequence will include linear epitopes within such sequence:

(I) (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of the peptide to a protein carrier or other peptide or polymerization through an added cysteine

residue by oxidation. Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide. When X and Y are present, a preferred embodiment exists when X and Y independently represent one or more cysteine or a combination of one or more cysteine with spacer amino acids. Preferred spacer amino acids are α -amino acid residues having a single side chain containing no more than four carbon atoms. Glycine is a particularly preferred spacer. Preferred peptides for use in oxidative polymerization are those in which X and Y together represent at least three cysteine residues. When two cysteine residues are present at the same end of the peptide, a preferred embodiment exists when the cysteine residues are separated by from one to three spacer amino acid residues, preferably glycine.

Preferably, this peptide will have no more than about 45 amino acids encoded by the HIV genome.

The next peptide II (123) will be encoded by the region extending from about bp 4385 to bp 4519 and will have the following sequence, where oligopeptides included within the following sequence will include linear epitopes within such sequence:

(II) (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-

Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z

wherein the amino terminal Y and the carboxy terminal X-Z have been defined previously.

Also if interest is the oligopeptide IIa:

(IIa) (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-

Trp-Lys-Gly-Glu-Gly-Ala-X-Z

wherein X, Y, and Z have been defined previously.

For the gag region peptide III (158) will be encoded by the region extending from about bp 897 to bp 986 and will have the following sequence, where oligopeptides included within the following sequence will include linear opitopes within such sequence:

(III) (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-

Asp-Arg-Val-His-Pro-X-Z

wherein X, Y, and Z have been defined previously.

Of particular interest is the use of the mercaptan group of cysteines or thioglycolic acids used for acylating terminal amino groups or the like for linking two of the peptides or oligopeptides or combinations thereof by a disulfide linkage or a longer linkage. To achieve this, compounds may be employed having bis-haloacetyl groups, nitroarylhalides, or the like, where the reagents are specific for thio groups. Thus, the linking between the two mercapto groups of the different peptides or oligopeptides may be a single bond or a linking group of at least 2, usually at least 4, and not more than about 16, usually not more than about 14 carbon atoms.

The subject peptides may be employed linked to a soluble macromolecular (e.g., ≥ 5 kDal) carrier. Conveniently, the carrier may be a poly(amino acid), either naturally occurring or synthetic, to which antibodies are unlikely to be encountered in human serum. Illustrative polypeptides include poly-L-lysine, bovine serum albumin, keyhole limpet hemocyanin, bovine gamma globulin, etc. The choice is primarily one of convenience and availability.

With such conjugates, there will be at least one molecule of at least one subject peptide per macromolecule and not more than about 1 per 0.5kDal, usually not more than about 1 per 2kDal of the macromolecule. One or more different peptides may be linked to the same macromolecule.

The manner of linking is conventional, employing such reagents as p-maleimidobenzoic acid, p-methyldithiobenzoic acid, maleic acid anhydride, succinic acid anhydride, glutaraldehyde, etc. The linkage may occur at the N-terminus, C-terminus or at a site intermediate to the ends of the molecule. The subject peptide may be derivatized by linking, may be linked while bound to a support, or the like.

The compounds may be employed as labeled or unlabeled compounds depending upon their use. (By label is intended a molecule which provides, directly or indirectly, a detectable signal.) Various labels may be employed, such as radionuclides, enzymes, fluorescers, chemiluminescers, enzyme substrates, cofactors or inhibitors, particles, e.g., magnetic particles, combinations of ligands and receptors, e.g., biotin and avidin, or the like. In addition, the polypeptides may be modified in a variety of ways for binding to a surface, e.g., microtiter plate, glass beads, chromatographic surface, e.g., paper, cellulose, silica gel, or the like. The particular manner in which the polypeptides are joined to another compound or surface is conventional and finds ample illustration in the literature. See, for example, U.S. Patent Nos. 4,371,515; 4,487,715; and patents cited therein.

Various assay protocols may be employed for detecting the presence of either antibodies to retroviral proteins or retroviral proteins themselves. Of particular interest is using the peptide as the labeled reagent, where the label allows for a detectable signal, or binding the peptide, either directly or indirectly to a surface, where antibody to the peptide in the sample will become bound to the peptide on the surface. The presence of human antibody bound to the peptide can then be detected by employing a xenogeneic antibody specific for human immunoglobulin, normally both human IgM and IgG, or a labeled protein specific for immune complexes, e.g., Rf factor or *S. aureus* protein A.

Various heterogeneous protocols may be employed, either competitive or non-competitive. Peptide may be bound to a surface or support ("support") and labeled antibody allowed to compete with antibody in the sample for the limited amount of bound peptide. The amount of label bound to the support would be related to

the amount of competitive antibody in the sample.

Antibody could be bound to the support and the sample combined with labeled peptide. After contact of the reaction mixture with the bound antibody, the amount of label bound to the support would relate to the amount of cognate antibody in the sample.

Xenogeneic anti-human antibody, e.g., antibodies to the F_c of IgG and IgM (immunoglobulins), could be bound to a support. The sample would be contacted with the immunoglobulins and labeled peptide, whereby the amount of labeled peptide bound to the support would be indicative of the presence of the cognate antibodies.

Alternatively, homogeneous assays can be employed where the peptide is bound to an enzyme, fluorescer, or other label, where the binding of antibody to the peptide results in being able to discriminate between the label involved with a specific binding pair complex and label which is not involved in the complex. For assays involving such techniques, see for example U.S. patent Nos. 3,817,837; 3,850,752; 3,901,654; 3,935,074; 3,984,533; 3,996,345; 4,034,074; and 4,098,876, whose disclosures are incorporated herein by reference.

As an illustration of the subject invention the subject peptides may be conjugated to a fluorescent molecule, such as fluorescein, rhodamine or umbelliferone. Various techniques may be used for detecting complex formation with antibodies, e.g., fluorescence polarization. In this assay the fluorescence polarization is different between complexed and uncomplexed peptide conjugate. Apparatuses are available for measuring changes in fluorescence polarization, e.g., TDx supplied by Abbott Laboratories, Chicago, Illinois.

Illustrative of an assay technique is the use of sample container, e.g., microtiter-plate wells, where the subject polypeptides or conjugates thereof are adhered to the container bottom and/or walls either covalently or non-covalently. The sample, normally human blood or serum diluted in an appropriately buffered medium, is added to the container and a sufficient time allowed for complex formation between the polypeptide(s) and any cognate antibodies in the sample. The supernatant is removed and the container washed to remove non-specifically bound proteins.

A labeled specific binding protein which specifically binds to the complex is employed for detection. To the container may be added xenogeneic antisera to human immunoglobulin, particularly anti(human IgM and IgG) in an appropriately buffered medium. The xenogeneic antisera will normally be labeled with a detectable label, e.g., radionuclide or enzyme. Instead of antisera, proteins specific for the immune complex may be employed, e.g., *S. aureus* protein A. The label may then be detected. For example, with an enzyme, after removal of non-specifically bound enzyme label, a developer solution is added. The developer solution will contain an enzyme substrate and possibly enzyme cofactors, chromogens, etc., which, upon reaction, provide a colored or fluorescent product which may be detected colorimetrically or fluorimetrically, respectively.

The peptides can be prepared in a wide variety of ways. The peptides, because of their relatively short size, may be synthesized in solution or on a solid support in accordance with conventional techniques. Various automatic synthesizers are commercially available today and can be used in accordance with known protocols. See, for example, Stewart and Young, *Solid Phase Peptide Synthesis*, 2nd ed., Pierce Chemical Co., 1984; and Tam et al., *J. Am. Chem. Soc.* (1983) 105:6442.

Alternatively, hybrid DNA technology may be employed where a synthetic gene may be prepared by employing single strands which code for the polypeptide or substantially complementary strands thereof, where the single strands overlap and can be brought together in an annealing medium so as to hybridize. The hybridized strands may then be ligated to form the complete gene, and, by choice of appropriate termini, the gene may be inserted into expression vectors, which are readily available today. See, for example, Maniatis et al., *Molecular Cloning, A Laboratory Manual*, CSH, Cold Spring Harbor Laboratory, 1982. Or, the region of the viral genome coding for the peptide may be cloned by conventional recombinant DNA techniques and expressed (see Maniatis, *supra*).

DNA coding sequences which may be used for expressing the peptides include the following:

I
(TGT GGA GGA TGT) CAG GTA AGA GAT CAG GCT GAA CAT CTT AAG ACA GCA GTA CAA ATG GCA GTA
TTC ATC CAC AAT TTT AAA AGA AAA GGG GGG ATT GGG GGG TAC AGT GCA GGG GAA AGA ATA GTA
GAC ATA ATA GCA ACA GAC ATA (TGT);

II
(TGT GGA GGA TGT) ATA GCA ACA GAC ATA CAA ACT AAA GAA TTA CAA AAA CAA ATT ACA AAA ATT
CAA AAT TTT CGG GTT TAT TAC AGG GAC AGC AGA GAT CCA CTT TGG AAA GGA CCA GCA AAG CTC
CTC TGG AAA GGT GAA GGG GCA (TGT).

III
CTA AAC ACA GTG GGG GGA CAT CAA GCA GCC ATG CAA ATG TTA AAA GAG ACC ATC AAT GAG GAA
GCT GCA GAA TGG GAT AGA GTG CAT CCA (TGT)

Fragments from these sequences may be employed for expression of peptide fragments, conservative base changes can be made, where the modified codon(s) code for the same amino acid(s), or non-conservative changes in the coding sequence may be made, where the resulting amino acid may be a conservative or non-conservative change in the amino acid sequence, which was discussed previously.

The coding sequence may be extended at either the 5'- or 3'-terminus or both termini to extend the peptide, while retaining its epitopic site. The extension may provide for an arm for linking, e.g., to a label, such as an enzyme, for joining two or all of the peptides together in the same chain, for providing antigenic activity, or the like.

For expression, the coding sequence will be provided with start and stop codons, promoter and terminator regions and usually a replication system to provide an expression vector for expression in a cellular host, e.g., prokaryotic or eukaryotic, bacterial, yeast, mammal, etc.

5 The sequences by themselves, fragments thereof, or larger sequences, usually at least 15 bases, preferably at least 18 bases, may be used as probes for detection of retroviral RNA or proviral DNA. Numerous techniques are described, such as the Grunstein-Hogness technique, Southern technique, Northern technique, dot-blot, improvements thereon, as well as other methodology. See, for example, WO 83/02277 and Berent et al., *Biotechniques* (1985) 3:208.

10 Conveniently, the polypeptides may be prepared as fused proteins, where the polypeptide may be the N- or C-terminus of the fused polypeptide. The resulting fused protein could be used directly by itself as the reagent or the subject polypeptide may be cleaved from all or a portion of the remaining sequence of the fused protein. With a polypeptide where there are no internal methionines, by introducing a methionine at the fusion site, the polypeptide may be cleaved employing cyanogen bromide. Where there is an internal methionine, it would be necessary to provide for a proteolytic cleavage site, e.g., poly-lysine and/or -arginine or combinations thereof, 15 or the internal methionine could be substituted by an amino acid such as leucine and an N-terminal methionine added for cyanogen bromide cleavage. A wide variety of proteases, including dipeptidases, are well known, and the appropriate processing signal could be introduced at the proper site. The processing signal may have tandem repeats so as to insure cleavage, since the presence of one or more extraneous amino acids will not interfere with the utility of the subject polypeptides.

20 Depending upon the nature of the assay, the physiological sample, e.g., saliva, blood, plasma, or serum, may be pretreated by dilution into an assay medium, which will usually be an aqueous buffered medium employing one of a variety of buffers, such as phosphate, tris, or the like. A preferred diluent is blotto (2.5% w/v nonfat dry milk, .01% thimerosal, .05% Antifoam A in .01 M sodium phosphate, pH 7.2, and .15 M NaCl). Usually the pH will be in the range of about 6 to 9. The sample will then be combined with the reagent in accordance with 25 the appropriate protocol and sufficient time allowed for binding. Where a heterogeneous system is used, usually the binding stages will be followed by washes to minimize non-specific binding. At the end of the procedure, the label will be detected in accordance with conventional methods.

Besides the use of the subject peptides and their analogs in assays, the subject peptides may also find use by themselves or in combination in vaccines. The peptides may be formulated in a convenient manner, 30 generally at concentrations in the range of 1 µg to 20 mg/kg of host. Physiologically acceptable media may be used as carriers, such as sterile water, saline, phosphate buffered saline, and the like. Adjuvants may be employed, such as aluminum hydroxide gel, or the like. Administration may be by injection, e.g., intramuscularly, peritoneally, subcutaneously, intravenously, etc. Administration may be one or a plurality of times, usually at one to four week intervals.

35 The following examples are offered by way of illustration and not by way of limitation.

EXPERIMENTAL

40 Peptides were assembled on a t-butyloxycarbonyl (BOC)-methylbenzylcysteine-phenyl-acetamidomethyl (PAM) polystyrene/divinylbenzene resin (Applied Biosystems, Inc., Foster City, California). Symmetrical anhydride couplings were carried out in an Applied Biosystems 430A synthesizer. Benzyl-based side chain protection and BOC alpha-amine protection were used. Tryptophan was protected by the formyl moiety and methionine by its sulfoxide, both protecting groups being removed by conventional procedures.

The peptides were radiolabeled by inclusion of a ³H-glycine residue within the sequence. The peptides were deprotected and cleaved from the resin by the Tam "low-high" HF protocol (Tam et al., *supra*). Peptides were 45 extracted from the resin in 5% acetic acid and subjected to gel filtration chromatography in 5% acetic acid.

The peptides synthesized above were sometimes oxidized through the cysteine residues to form network polymers. This was carried out by dissolving the lyophilized peptide in 0.1 M carbonate/bicarbonate, 6 M guanidine-HCl pH 9.0 at a concentration of 5-10 mg/ml. The pH of the resulting solution is checked and adjusted to a pH of 9.0 if required and the solution is allowed to stir at room temperature overnight. Resultant 50 solutions are used as a coating antigen in the ELISA assays described below.

Analysis by ELISA

55 Peptides 123, 124 and 126 were stored as stock solutions of 4 mg/ml in 6 M Gu-HCl or as the oxidized peptide stocks described above. Peptides 158 and 158E were stored at 4 mg/ml in 0.05 M carbonate/bicarbonate buffer (pH 9.6). The peptides were diluted in 0.05 M carbonate/bicarbonate buffer (pH 9.6) to a final concentration of 5-800 µg/ml. One hundred µl aliquotes were added per microtiter well and incubated at 4° C overnight. Plates were then blocked with blotto (5% [w/v] nonfat dry milk, 0.01% thimerosal, 0.01% Antifoam A in 0.01 M sodium phosphate, pH 7.2, 0.15 M sodium chloride) for one hour at 37° C. Serum or plasma samples were diluted 1:101 or 1:21 with diluent (2.5% [w/v] nonfat dry milk, 0.01% thimerosal, 60 0.005% Antifoam A in 20 mM sodium citrate) and 100 µl of diluted serum or plasma was added per well for one hour at 37° C. The sera or plasma were aspirated, and the plates were washed three times in wash buffer (0.15 M NaCl, 0.05% [w/v] Tween 20) before adding 100 µl of the goat anti-human Ig/horseradish peroxidase conjugate (diluted 1:10,000 in diluent containing 1% normal goat serum in citrate buffer, pH 7.0) for one hour at 37° C. The conjugate was removed, and the plates were again washed three times as described above. The 65 ELISA assay was developed by adding 100 µl/well of substrate solution (80 µg/ml tetramethylbenzidine,

0.0015% hydrogen peroxide in citrate/phosphate buffer pH 6.0) for thirty minutes at room temperature. Reactions were stopped with the addition of 100 μ l of 3N H₂SO₄ per well, and the ratio of the optical density at 450 nm to 530 nm was determined by an automated ELISA reader.

Peptides from the pol region were tested in the ELISA format replacing whole virus lysate in the Genetic Systems Corp. LAV EIA assay. Sera were diluted 1:101 and the peptides were used in both oxidized and unoxidized forms. Peptide I(123) recognized 30 of 34 positive test sera as positive and 11 of 11 negative sera as negative (Table I). Peptide II recognized 32 of 34 positive sera as positive and 11 of 11 negative sera as negative. The removal of 12 amino acids from the amino terminus of peptide II did not reduce the ability of the sequence to differentiate HIV positive sera.

Use of the peptides in an oxidized form, which is not necessary for these particular peptides to function in the assay, increased the total amount of signal from each sample. This may be due to an increase in the amount of peptide adsorbed to the microtiter plate.

Peptide III(158) from the gag region of the HIV genome tested in the ELISA format was used, plating 80 μ g/well, to screen both plasma and serum samples. The data summarized in Table II demonstrates that peptide 158 recognizes 13 of 17 p25 positive plasma and sera.

In an alternate assay peptide 158E, a modification of peptide 158 in which the methionines were replaced with norleucine, the sera or plasma were diluted 1:21 in diluent buffer, the incubation times with the sample and conjugate were reduced to 30 min, and the washes between the steps were increased to six. These changes resulted in 17 of 17 positive samples being recognized.

Results of the serum screen are presented in Table I and are summarized as follows:

TABLE 1

40

It is evident from the foregoing results that by employing one or a combination of peptides of the subject invention, a sensitive, accurate test for the presence of antibodies to AIDS is provided. The subject peptides can be used by themselves or in combination with a screening assay or confirmatory assay, whereas the complete lysate or complete antigens may be employed as an independent procedure. Furthermore, because of the specificities of the peptides, one would anticipate that the DNA sequences coding for the peptides would also find similar specificity in a DNA hybridization assay. Thus, the subject invention allows for the detection of patients who have been exposed to the retroviral etiologic agent of lymphadenopathy syndrome and/or AIDS.

45

All publications and patent applications mentioned in this specification are indicative of the level of skill of those skilled in the art to which this invention pertains. All publications and patent applications are herein incorporated by reference to the same extent as if each individual publication or patent application was specifically and individually indicated to be incorporated by reference.

50

The invention now being fully described, it will be apparent to one of ordinary skill in the art that many changes and modifications can be made thereto without departing from the spirit or scope of the appended claims.

55

Claims

60

1. In a method for detecting the presence of HIV virus or antibody to HIV virus where a sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to such protein composition to form a specific binding pair complex and the amount of complex formation is determined, an improvement which comprises:

65

employing in the assay medium as a reagent a composition, containing at least one peptide which has at

least five amino acids and fewer than 50 amino acids and is encoded for by the coding region of HIV from bp 4265 to bp 4519 or from bp 897 to bp 982.

2. A method according to Claim 1, wherein said coding region is from bp 4265 to bp 4399 or from bp 4385 to bp 4519.

3. A method according to Claim 1, wherein said coding region is from bp 4430 to bp 4519.

4. In a method for detecting the presence of HIV virus or antibody to HIV virus where a sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to each such protein composition to form at least one specific binding pair complex and the amount of complex formation is determined, an improvement which comprises:

employing in the assay medium as a reagent a composition containing at least one peptide which has at least five amino acids in a sequence which comes within the sequence of at least one of the following peptide sequences:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z; or

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to other peptides, and Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

5. A method according to Claim 4, wherein one of the peptides has one of the following sequences:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z; or

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z;

6. A method according to any one of Claims 1 to 5, wherein said composition is bound to a solid surface.

7. A method according to any one of Claims 1 to 6, wherein said peptide is conjugated to a water soluble protein of at least 5kDa as said macromolecule.

8. A method according to any one of Claims 1 to 7 wherein two of said peptides are covalently linked together through a bond or bridging group.

9. A method for determining the presence of antibodies to HIV in a physiological fluid, said method comprising;

combining a human serum, plasma or blood sample with at least one labeled peptide having at least five amino acids in a sequence which comes within the sequence of at least one of the following peptide sequences:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z; or

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to other peptides, and Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and said peptide is conjugated to a protein for which antibodies in human sera are substantially absent or is unconjugated to a protein;

incubating for a sufficient time for complex formation to occur; and

determining the formation of complex as a result of change in a detectable signal resulting from complex formation.

10. A method according to Claim 9, wherein said label is a fluorescer.

11. A method according to Claim 9, wherein said label is an enzyme.

12. A vaccine composition comprising at least one peptide of peptides having the formulas:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z; or

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to other peptides, and Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and said peptides conjugated to an immunogenic protein, said peptides or conjugates being present in an amount to provide an immunogenic response in a physiologically acceptable carrier.

13. A vaccine according to Claim 12, wherein said peptides are coupled to immunogenic proteins.

14. A peptide of the formula:

(I) (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z;

(II) (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z;

(IIa) (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z; or

(III) (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to other peptides, and Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

15. The protein of Claim 14, wherein said protein has formula (I) (126).

16. The protein of Claim 14, wherein said protein has formula (II) (123).

17. The protein of Claim 14, wherein said protein has formula (IIa) (124).

18. The protein of Claim 14, wherein said protein has formula (III) (158).

19. A method of preparing a peptide according to any one of Claims 14 to 18, e.g. using an automatic synthesizer or by hybrid or recombinant DNA technology.

20. A method of preparing a vaccine composition according to Claim 12 or Claim 13 comprising formulating said peptides or conjugates with a physiologically acceptable medium, adjuvant or carrier.

21. A method of preparing a reagent referred to in any one of Claims 1 to 11 comprising appropriately formulating said at least one peptide.

Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description**BACKGROUND OF THE INVENTION**5 **Field of the Invention**

With the discovery that the diseases called lymphadenopathy syndrome and acquired immune deficiency disease (AIDS) are caused by an infectious retrovirus designated lymphadenopathy virus (LAV), human T-cell lymphotropic virus-III (HTLV-III), AIDS-related virus (ARV), or immune deficiency-associated virus (IDAV), there has become an immediate need to be able to detect potential vectors of the disease, such as blood from diseased individuals, which may be employed for transfusions or from which specific blood factors may be isolated.

To detect potential vectors of the disease, it is necessary to have viral proteins and/or antibodies to such proteins. Because of the hazards associated with growing the LAV/HTLV-III retrovirus, there is significant interest in establishing means for obtaining the viral proteins or their immunologic equivalents, which means do not necessitate handling large volumes of live, potentially infectious virus. In choosing alternatives, one must be concerned with the fact that the viruses have been reported to be highly polymorphic, frequently changing as the retrovirus is passaged.

Brief Description of the Relevant Literature

20 The various antigens of the retrovirus are described by Saxinger *et al.*, *Science* (1985) 227:1036-1038. See also Gallo *et al.*, *ibid.* (1984) 224:500; Sarangadham *et al.*, *ibid.* 224:506; Barre-Sinoussi *et al.*, *ibid.* (1983) 220:868; Montagnier *et al.*, in *Human T-Cell Leukemia/Lymphoma Virus*, Gallo, Essex, Gross, eds. (Cold Spring Harbor Laboratory, Cold Spring Harbor, New York), 1984, p. 363. These may include, but are not limited to, p13, p18, p25, p36, gp43, p55, gp65, gp110, etc., where the numbers may differ depending upon the reporter.

25 Hopp and Woods, *Proc. Natl. Acad. Sci. USA* (1981) 78:3824, describe criteria for selecting peptides as potential epitopes of polypeptides based on their relative hydrophilicity. In one study employing these criteria, a 12-amino acid peptide was synthesized that bound 9% of antibodies elicited by the native protein (Hopp, *Molec. Immunol.* (1981) 18:869). In general, Hopp/Woods criteria have been shown not to have a high predictive value. Furthermore, epitopes have been demonstrated which are not hydrophilic (Kazim *et al.*, *Biochem. J.* (1982) 203:201). Other studies of polypeptide antigenicity include Green *et al.*, *Cell* (1982) 28:477, where peptides were employed which elicited antibodies, which antibodies were capable of binding to the native protein, while conversely antibodies which were elicited by the native protein failed to bind the peptides, and Trainer *et al.*, *Nature* (1984) 312:127, whose results with myohaemerythrin paralleled those of Green *et al.*

35 The complete nucleotide sequence of LAV is reported by Wain-Hobson *et al.*, *Cell* (1985) 40:9. The complete sequence for HTLV-III is reported by Muesing *et al.*, *Nature* (1985) 313:450, while the complete sequence for ARV is reported by Sanchez-Pescadore *et al.*, *Science* (1985) 227:484. All three viruses exhibit substantial nucleotide homology and are similar with respect to morphology, cytopathology, requirements for optimum reverse transcriptase activity, and at least some antigenic properties (Levy *et al.*, *Science* (1984) 225:840; Shupbach *et al.*, *Science* (1984) 224:503), and hence should be considered isolates of the same virus. See also, Chang *et al.*, *Science* (1985) 228:93. 40 Based on these and other data the Human Retrovirus Subcommittee of the International Committee on the Taxonomy of Viruses has proposed the name Human Immuno-deficiency Virus (HIV) for this group of closely related viruses (*Science* (1986) 232:697). This designation will be used within this application.

European Patent Application EP-A-0181150 discloses the cloning and expression of genes from a strain of HIV-1, known as ARV-2. European Patent Application EP-A-0225066, which forms part of the state of the art under Article 54(3) and (4) EPC, discloses certain antigen determinants from the pol region of HIV. International Patent Application 45 W086/06414 discloses certain peptides from the gag region HIV.

SUMMARY OF THE INVENTION

50 Peptide sequences capable of immunologically mimicking proteins encoded in the pol and gag regions of the HIV retrovirus are provided as reagents for use in the screening of blood and blood products for prior exposure to the retrovirus. The peptides are at least 5 amino acids in length and can be used in various specific binding assays for the detection of antibodies to HIV virus, for the detection of HIV antigens, or as immunogens.

55 **DESCRIPTION OF THE SPECIFIC EMBODIMENTS**

For the purpose of this disclosure, a virus is considered to be the same as or equivalent to HIV if it substantially fulfills the following criteria:

- (a) The virus is tropic for T-lymphocytes, especially T-helper cells (CD⁴⁺, according to the international nomenclature defined in Bernard *et al.*, eds. Leucocyte Typing, New-York: Springer Verlag, 1984);
- (b) The virus is cytopathic for infected CD⁴⁺ cells (rather than transforming, as are HTLV-I and -II);
- (c) The virus encodes an RNA-dependent DNA polymerase (reverse transcriptase) which is Mg²⁺-dependent (optimum concentration 5mM), has a pH optimum of 7.8, is not inhibitable by actinomycin D, and can employ oligo(dT)₁₂₋₁₈ as a primer for reverse transcription from its 3' LTR;
- (d) The virus bands in a sucrose gradient at a density of approximately 1.16;
- (e) The virus can be labeled with [³H]-uridine;
- (f) The virus is substantially cross-reactive immunologically with the proteins encoded by the gag, env, and pol regions of HIV; and
- (g) The virus shares substantial nucleotide homology (approximately 75-100%) and amino acid sequence homology (approximately 75-100%) with LAV or HTLV-III.

Novel peptides are provided which immunologically mimic proteins encoded by the HIV retrovirus, particularly proteins encoded by the pol region of the viral genome. To accommodate strain-to-strain variations among different isolates, adjustments for conservative substitutions, and selection among the alternatives where non-conservative substitutions are involved, may be made. These peptides can be used individually or together for detection of the virus or of antibodies to the virus in a physiological sample. Depending upon the nature of the test protocol, the peptides may be labeled or unlabeled, bound to a solid surface, conjugated to a carrier or other compounds, or the like.

The peptides of interest will be derived from the peptides encoded by the pol and gag regions. These peptides will be primarily derived from p31 of the pol region and from p25 of the gag region. These peptides will be given Roman numerals and will also be given numerical designations, which are arbitrarily associated with the manner in which they were produced, in this application. Of particular interest is the coding region extending from about base pair (bp) 4255 to bp 4519, particularly from about bp 4265 to bp 4399 and from bp 4385 to bp 4519, including a shorter segment from bp 4430 to bp 4519. Also, the coding region extending from about bp 897 to bp 986 is of particular interest. (Numbering according to Wain-Hobson *et al.*, *supra*.)

The peptides of interest will include at least 5, sometimes 6, sometimes 8, sometimes 12, usually fewer than about 50, more usually fewer than about 35, and preferably fewer than about 25 amino acids included within a sequence coded for by the HIV retrovirus. In each instance, desirably the oligopeptide will be as small as possible while still maintaining substantially all of the sensitivity of the larger peptide. In some instances it may be desirable to join two or more oligopeptides which are non-overlapping to form a single peptide structure or to use them as individual peptides at the same tie, which separately or together provide equivalent sensitivity to the parent.

The peptides may be modified by introducing conservative or non-conservative substitutions in the peptides, usually fewer than 20 number percent, more usually fewer than 10 number percent of the amino acids being exchanged. In those situations where regions are found to be polymorphic, it may be desirable to vary one or more particular amino acids to more effectively mimic the differing epitopes of the different retroviral strains.

It should be understood that the polypeptides employed in the subject invention need not be identical to any particular HIV polypeptide sequence, so long as the subject compounds are able to provide for immunological competition with proteins of at least one of the strains of the HIV retrovirus. Therefore, the subject polypeptides may be subject to various changes, such as insertions, deletions, and substitutions, either conservative or non-conservative, where such changes might provide for certain advantages in their use. By conservative substitutions is intended substitutions within groups such as Gly, Ala; Val, Ile, Leu; Asp, Glu; Asn, Gln; Ser, Thr; Lys, Arg; Phe, Tyr; and Norleu, Met. Usually, the sequence will not differ by more than 20% from the sequence of at least one strain of an HIV retrovirus except where additional amino acids may be added at either terminus for the purpose of providing an "arm" by which the peptides of this invention may be conveniently immobilized. The arms will usually be at least 1 amino acid and may be 50 or more amino acids, more often 1 to 10 amino acids, in length.

In addition, one or two amino acids may be added to the termini of an oligopeptide or peptide to provide for ease of linking of peptides one to another, for coupling to a support or larger peptide, for reasons to be discussed subsequently, for modifying the physical or chemical properties of the peptide or oligopeptide, or the like.

Amino acids such as tyrosine, cysteine, lysine, glutamic or aspartic acid, or the like may be introduced at the C- or N-terminus of the peptide or oligopeptide to provide for a useful functionality for linking. Cysteine is particularly preferred to facilitate covalent coupling to other peptides or to form polymers by oxidation. Combinations of cysteine with intervening amino acid spacers are also useful. For example, two cysteine residues can be separated by one or more α -amino acid residues having a single side chain containing no more than four carbon atoms (small size being desired to avoid interference with coupling reactions). Glycine residues are preferred for this reason, particularly one to three glycine residues between amino acids added to facilitate coupling. Cysteine residues are particularly useful in forming network polymers by oxidation. In such cases it is preferred to have at least three cysteine residues present in the molecules being linked, preferably by utilizing cysteine residues added to the terminal portions of the peptides.

In addition, the peptide or oligopeptide sequences may differ from the natural sequence by the sequence being modified by terminal-NH₂ acylation, e.g., acetylation, or thioglycolic acid amidation, terminal-carboxy amidation, e.g., with ammonia or methylamine, to provide sites for linking to a support or other molecule.

The peptides and oligopeptides of interest will now be considered. Peptide I (126) encoded in the region bp 4265 to bp 4399 will have the following amino acid sequence, where oligopeptides included within the following sequence will include linear epitopes within such sequence:

(I) (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-
Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-
Ile-Ile-Ala-Thr-Asp-Ile-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of the peptide to a protein carrier or other peptide or polymerization through an added cysteine residue by oxidation. Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide. When X and Y are present, a preferred embodiment exists when X and Y independently represent one or more cysteine or a combination of one or more cysteine with spacer amino acids. Preferred spacer amino acids are α -amino acid residues having a single side chain containing no more than four carbon atoms. Glycine is a particularly preferred spacer. Preferred peptides for use in oxidative polymerization are those in which X and Y together represent at least three cysteine residues. When two cysteine residues are present at the same end of the peptide, a preferred embodiment exists when the cysteine residues are separated by from one to three spacer amino acid residues, preferably glycine.

Preferably, this peptide will have no more than about 45 amino acids encoded by the HIV genome.

The next peptide II (123) will be encoded by the region extending from about bp 4335 to bp 4519 and will have the following sequence, where oligopeptides included within the following sequence will include linear epitopes within such sequence:

(II) (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-
Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-
Trp-Lys-Gly-Glu-Gly-Ala-X-Z

wherein the amino terminal Y and the carboxy terminal X-Z have been defined previously.

Also of interest is the oligopeptide IIa:

(IIa) (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z

wherein X, Y, and Z have been defined previously.

For the gag region peptide III (158) will be encoded by the region extending from about bp 897 to bp 986 and will have the following sequence, where oligopeptides included within the following sequence will include linear epitopes within such sequence:

(III) (158)

**Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 5 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-
 Arg-Val-His-Pro-X-Z**

wherein X, Y, and Z have been defined previously.

10 Of particular interest is the use of the mercaptan group of cysteines or thioglycolic acids used for acylating terminal amino groups or the like for linking two of the peptides or oligopeptides or combinations thereof by a disulfide linkage or a longer linkage. To achieve this, compounds may be employed having bis-haloacetyl groups, nitroarylhalides, or the like, where the reagents are specific for thio groups. Thus, the linking between the two mercapto groups of the different peptides or oligopeptides may be a single bond or a linking group of at least 2, usually at least 4, and not more than about 16, usually not more than about 14 carbon atoms.

15 The subject peptides may be employed linked to a soluble macromolecular (e.g., ≥ 5 kDal) carrier. Conveniently, the carrier may be a poly(amino acid), either naturally occurring or synthetic, to which antibodies are unlikely to be encountered in human serum. Illustrative polypeptides include poly-L-lysine, bovine serum albumin, keyhole limpet hemocyanin, bovine gamma globulin, etc. The choice is primarily one of convenience and availability.

20 With such conjugates, there will be at least one molecule of at least one subject peptide per macromolecule and not more than about 1 per 0.5kDal, usually not more than about 1 per 2kDal of the macromolecule. One or more different peptides may be linked to the same macromolecule.

25 The manner of linking is conventional, employing such reagents as p-maleimidobenzoic acid, p-methyldithiobenzoic acid, maleic acid anhydride, succinic acid anhydride, glutaraldehyde, etc. The linkage may occur at the N-terminus, C-terminus or at a site intermediate to the ends of the molecule. The subject peptide may be derivatized by linking, may be linked while bound to a support, or the like.

30 The compounds may be employed as labeled or unlabeled compounds depending upon their use. (By label is intended a molecule which provides, directly or indirectly, a detectable signal.) Various labels may be employed, such as radionuclides, enzymes, fluorescers, chemiluminescers, enzyme substrates, cofactors or inhibitors, particles, e.g., magnetic particles, combinations of ligands and receptors, e.g., biotin and avidin, or the like. In addition, the polypeptides may be modified in a variety of ways for binding to a surface, e.g., microtiter plate, glass beads, chromatographic surface, e.g., paper, cellulose, silica gel, or the like. The particular manner in which the polypeptides are joined to another compound or surface is conventional and finds ample illustration in the literature. See, for example, U.S. Patent Nos. 4,371,515; 4,487,715; and patents cited therein.

35 Various assay protocols may be employed for detecting the presence of either antibodies to retroviral proteins or retroviral proteins themselves. Of particular interest is using the peptide as the labeled reagent, where the label allows for a detectable signal, or binding the peptide, either directly or indirectly to a surface, where antibody to the peptide in the sample will become bound to the peptide on the surface. The presence of human antibody bound to the peptide can then be detected by employing a xenogeneic antibody specific for human immunoglobulin, normally both human IgM and IgG, or a labeled protein specific for immune complexes, e.g., Rf factor or S. aureus protein A.

40 Various heterogeneous protocols may be employed, either competitive or non-competitive. Peptide may be bound to a surface or support ("support") and labeled antibody allowed to compete with antibody in the sample for the limited amount of bound peptide. The amount of label bound to the support would be related to the amount of competitive antibody in the sample.

45 Antibody could be bound to the support and the sample combined with labeled peptide. After contact of the reaction mixture with the bound antibody, the amount of label bound to the support would relate to the amount of cognate antibody in the sample.

Xenogeneic anti-human antibody, e.g., antibodies to the F_c of IgG and IgM (immunoglobulins), could be bound to a support. The sample would be contacted with the immunoglobulins and labeled peptide, whereby the amount of labeled peptide bound to the support would be indicative of the presence of the cognate antibodies.

50 Alternatively, homogeneous assays can be employed where the peptide is bound to an enzyme, fluorescer, or other label, where the binding of antibody to the peptide results in being able to discriminate between the label involved with a specific binding pair complex and label which is not involved in the complex. For assays involving such techniques, see for example U.S. patent Nos. 3,817,837; 3,850,752; 3,901,654; 3,935,074; 3,984,533; 3,996,345; 4,034,074; and 4,098,876, whose disclosures are incorporated herein by reference.

55 As an illustration of the subject invention the subject peptides may be conjugated to a fluorescent molecule, such as fluorescein, rhodamine or umbelliferone. Various techniques may be used for detecting complex formation with antibodies, e.g., fluorescence polarization. In this assay the fluorescence polarization is different between complexed

and uncomplexed peptide conjugate. Apparatuses are available for measuring changes in fluorescence polarization, e.g., TDx supplied by Abbott Laboratories, Chicago, Illinois.

Illustrative of an assay technique is the use of sample container, e.g., microtiter-plate wells, where the subject polypeptides or conjugates thereof are adhered to the container bottom and/or walls either covalently or non-covalently. The sample, normally human blood or serum diluted in an appropriately buffered medium, is added to the container and a sufficient time allowed for complex formation between the polypeptide(s) and any cognate antibodies in the sample. The supernatant is removed and the container washed to remove non-specifically bound proteins.

A labeled specific binding protein which specifically binds to the complex is employed for detection. To the container may be added xenogeneic antisera to human immunoglobulin, particularly anti(human IgM and IgG) in an appropriately buffered medium. The xenogeneic antisera will normally be labeled with a detectable label, e.g., radionuclide or enzyme. Instead of antisera, proteins specific for the immune complex may be employed, e.g., *S. aureus* protein A. The label may then be detected. For example, with an enzyme, after removal of non-specifically bound enzyme label, a developer solution is added. The developer solution will contain an enzyme substrate and possibly enzyme cofactors, chromogens, etc., which, upon reaction, provide a colored or fluorescent product which may be detected colorimetrically or fluorimetrically, respectively.

The peptides can be prepared in a wide variety of ways. The peptides, because of their relatively short size, may be synthesized in solution or on a solid support in accordance with conventional techniques. Various automatic synthesizers are commercially available today and can be used in accordance with known protocols. See, for example, Stewart and Young, *Solid Phase Peptide Synthesis*, 2nd ed., Pierce Chemical Co., 1984; and Tam et al., *J. Am. Chem. Soc.* (1983) 105:6442.

Alternatively, hybrid DNA technology may be employed where a synthetic gene may be prepared by employing single strands which code for the polypeptide or substantially complementary strands thereof, where the single strands overlap and can be brought together in an annealing medium so as to hybridize. The hybridized strands may then be ligated to form the complete gene, and, by choice of appropriate termini, the gene may be inserted into expression vectors, which are readily available today. See, for example, Maniatis et al., *Molecular Cloning, A Laboratory Manual*, CSH, Cold Spring Harbor Laboratory, 1982. Or, the region of the viral genome coding for the peptide may be cloned by conventional recombinant DNA techniques and expressed (see Maniatis, *supra*).

DNA coding sequences which may be used for expressing the peptides include the following:

I (TGT GGA GGA TGT) CAG GTA AGA GAT CAG GCT GAA CAT
CTT AAG ACA GCA GTA CAA ATG GCA GTA TTC ATC CAC
AAT TTT AAA AGA AAA GGG GGG ATT GGG GGG TAC AGT
GCA GGG GAA AGA ATA GTA GAC ATA ATA GCA ACA GAC
ATA (TGT);

II (TGT GGA GGA TGT) ATA GCA ACA GAC ATA CAA ACT AAA
GAA TTA CAA AAA CAA ATT ACA AAA ATT CAA AAT TTT
CGG GTT TAT TAC AGG GAC AGC AGA GAT CCA CTT TGG
AAA GGA CCA GCA AAG CTC CTC TGG AAA GGT GAA GGG
GCA (TGT).

III CTA AAC ACA GTG GGG GGA CAT CAA GCA GCC ATG CAA
ATG TTA AAA GAG ACC ATC AAT GAG GAA GCT GCA GAA
TGG GAT AGA GTG CAT CCA (TGT)

Fragments from these sequences may be employed for expression of peptide fragments, conservative base changes can be made, where the modified codon(s) code for the same amino acid(s), or non-conservative changes in the

coding sequence may be made, where the resulting amino acid may be a conservative or non-conservative change in the amino acid sequence, which was discussed previously.

The coding sequence may be extended at either the 5'- or 3'-terminus or both termini to extend the peptide, while retaining its epitopic site. The extension may provide for an arm for linking, e.g., to a label, such as an enzyme, for joining two or all of the peptides together in the same chain, for providing antigenic activity, or the like.

For expression, the coding sequence will be provided with start and stop codons, promoter and terminator regions and usually a replication system to provide an expression vector for expression in a cellular host, e.g., prokaryotic or eukaryotic, bacterial, yeast, mammal, etc.

The sequences by themselves, fragments thereof, or larger sequences, usually at least 15 bases, preferably at least 18 bases, may be used as probes for detection of retroviral RNA or proviral DNA. Numerous techniques are described, such as the Grunstein-Hogness technique, Southern technique, Northern technique, dot-blot, improvements thereon, as well as other methodology. See, for example, WO 83/02277 and Berent *et al.*, *Biotechniques* (1985) 3:208.

Conveniently, the polypeptides may be prepared as fused proteins, where the polypeptide may be the N- or C-terminus of the fused polypeptide. The resulting fused protein could be used directly by itself as the reagent or the subject polypeptide may be cleaved from all or a portion of the remaining sequence of the fused protein. With a polypeptide where there are no internal methionines, by introducing a methionine at the fusion site, the polypeptide may be cleaved employing cyanogen bromide. Where there is an internal methionine, it would be necessary to provide for a proteolytic cleavage site, e.g., poly-lysine and/or -arginine or combinations thereof, or the internal methionine could be substituted by an amino acid such as leucine and an N-terminal methionine added for cyanogen bromide cleavage. A wide variety of proteases, including dipeptidases, are well known, and the appropriate processing signal could be introduced at the proper site. The processing signal may have tandem repeats so as to insure cleavage, since the presence of one or more extraneous amino acids will not interfere with the utility of the subject polypeptides.

Depending upon the nature of the assay, the physiological sample, e.g., saliva, blood, plasma, or serum, may be pretreated by dilution into an assay medium, which will usually be an aqueous buffered medium employing one of a variety of buffers, such as phosphate, tris, or the like. A preferred diluent is blotto (2.5% w/v nonfat dry milk, .01% thimerosol, .05% Antifoam A in .01 M sodium phosphate, pH 7.2, and .15 M NaCl). Usually the pH will be in the range of about 6 to 9. The sample will then be combined with the reagent in accordance with the appropriate protocol and sufficient time allowed for binding. Where a heterogeneous system is used, usually the binding stages will be followed by washes to minimize non-specific binding. At the end of the procedure, the label will be detected in accordance with conventional methods.

Besides the use of the subject peptides and their analogs in assays, the subject peptides may also find use by themselves or in combination in vaccines. The peptides may be formulated in a convenient manner, generally at concentrations in the range of 1 µg to 20 mg/kg of host. Physiologically acceptable media may be used as carriers, such as sterile water, saline, phosphate buffered saline, and the like. Adjuvants may be employed, such as aluminum hydroxide gel, or the like. Administration may be by injection, e.g., intramuscularly, intraperitoneally, subcutaneously, intravenously, etc. Administration may be one or a plurality of times, usually at one to four week intervals.

The following examples are offered by way of illustration and not by way of limitation.

EXPERIMENTAL

Peptides were assembled on a t-butyloxycarbonyl (BOC)-methylbenzylcysteine-phenyl-acetamidomethyl (PAM) polystyrene/divinylbenzene resin (Applied Biosystems, Inc., Foster City, California). Symmetrical anhydride couplings were carried out in an Applied Biosystems 430A synthesizer. Benzyl-based side chain protection and BOC alpha-amine protection were used. Tryptophan was protected by the formyl moiety and methionine by its sulfoxide, both protecting groups being removed by conventional procedures.

The peptides were radiolabeled by inclusion of a ³H-glycine residue within the sequence. The peptides were deprotected and cleaved from the resin by the Tam "low-high" HF protocol (Tam *et al.*, *supra*). Peptides were extracted from the resin in 5% acetic acid and subjected to gel filtration chromatography in 5% acetic acid.

The peptides synthesized above were sometimes oxidized through the cysteine residues to form network polymers. This was carried out by dissolving the lyophilized peptide in 0.1 M carbonate/bicarbonate, 6 M guanidine-HCl pH 9.0 at a concentration of 5-10 mg/ml. The pH of the resulting solution is checked and adjusted to a pH of 9.0 if required and the solution is allowed to stir at room temperature overnight. Resultant solutions are used as a coating antigen in the ELISA assays described below.

Analysis by ELISA

Peptides 123, 124 and 126 were stored as stock solutions of 4 mg/ml in 6 M Gu-HCl or as the oxidized peptide stocks described above. Peptides 158 and 158E were stored at 4 mg/ml in 0.05 M carbonate/bicarbonate buffer (pH

9.6). The peptides were diluted in 0.05 M carbonate/bicarbonate buffer (pH 9.6) to a final concentration of 5-800 µg/ml. One hundred µl aliquotes were added per microtiter well and incubated at 4°C overnight. Plates were then blocked with blotto (5% [w/v] nonfat dry milk, 0.01% thimerasol, 0.01% Antifoam A in 0.01 M sodium phosphate, pH 7.2, 0.15 M sodium chloride) for one hour at 37°C. Serum or plasma samples were diluted 1:101 or 1:21 with diluent (2.5% [w/v] nonfat dry milk, 0.01% thimerasol, 0.005% Antifoam A in 20 mM sodium citrate) and 100 µl of diluted serum or plasma was added per well for one hour at 37°C. The sera or plasma were aspirated, and the plates were washed three times in wash buffer (0.15 M NaCl, 0.05% [w/v] Tween 20) before adding 100 µl of the goat anti-human Ig/horseradish peroxidase conjugate (diluted 1:10,000 in diluent containing 1% normal goat serum in citrate buffer, pH 7.0) for one hour at 37°C. The conjugate was removed, and the plates were again washed three times as described above. The ELISA assay was developed by adding 100 µl/well of substrate solution (80 µg/ml tetramethylbenzidine, 0.0015% hydrogen peroxide in citrate/phosphate buffer pH 6.0) for thirty minutes at room temperature. Reactions were stopped with the addition of 100 µl of 3N H₂SO₄ per well, and the ratio of the optical density at 450 nm to 630 nm was determined by an automated ELISA reader.

Peptides from the pol region were tested in the ELISA format replacing whole virus lysate in the Genetic Systems Corp. LAV EIA assay. Sera were diluted 1:101 and the peptides were used in both oxidized and unoxidized forms. Peptide I(123) recognized 30 of 34 positive test sera as positive and 11 of 11 negative sera as negative (Table I). Peptide II recognized 32 of 34 positive sera as positive and 11 of 11 negative sera as negative. The removal of 12 amino acids from the amino terminus of peptide II did not reduce the ability of the sequence to differentiate HIV positive sera.

Use of the peptides in an oxidized form, which is not necessary for these particular peptides to function in the assay, increased the total amount of signal from each sample. This may be due to an increase in the amount of peptide adsorbed to the microtiter plate.

Peptide III(158) from the gag region of the HIV genome tested in the ELISA format was used, plating 80 µg/well, to screen both plasma and serum samples. The data summarized in Table II demonstrates that peptide 158 recognizes 13 of 17 p25 positive plasma and sera.

In an alternate assay peptide 158E, a modification of peptide 158 in which the methionines were replaced with norleucine, the sera or plasma were diluted 1:21 in diluent buffer, the incubation times with the sample and conjugate were reduced to 30 min, and the washes between the steps were increased to six. These changes resulted in 17 of 17 positive samples being recognized.

Results of the serum screen are presented in Table I and are summarized as follows:

TABLE 1
ELISA Data for Serum Screen of pol Peptides

Serum I.O. Number	Diagnosis	Western Blot Confirmation	ELISA Using Whole Virus Lysate	123 Peptide 0.5µg/well	123ox Peptide 0.5µg/well	124 Peptide 0.25µg/well	124ox Peptide 0.25µg/well	126 Peptide 1.0µg/well	126ox Peptide 2.0µg/well

It is evident from the foregoing results that by employing one or a combination of peptides of the subject invention, a sensitive, accurate test for the presence of antibodies to AIDS is provided. The subject peptides can be used by themselves or in combination with a screening assay or confirmatory assay, whereas the complete lysate or complete antigens may be employed as an independent procedure.

Furthermore, because of the specificities of the peptides, one would anticipate that the DNA sequences coding for the peptides would also find similar specificity in a DNA hybridization assay. Thus, the subject invention allows for the detection of patients who have been exposed to the retroviral etiologic agent of lymphadenopathy syndrome and/or AIDS.

All publications and patent applications mentioned in this specification are indicative of the level of skill of those skilled in the art to which this invention pertains.

Claims

Claims for the following Contracting States : AT, BE, CH, LI, DE, FR, GB, GR, IT, LU, NL, SE

- A method of detecting the presence of antibody to HIV virus in a sample where the sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to such protein composition to form at least one specific binding pair complex and the amount of complex formation is determined, characterized in that :

the assay medium comprises a reagent containing at least one peptide of at least five and fewer than fifty amino acids in a sequence which comes within the sequence of at least one of the following peptide sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

2. A method according to claim 1, wherein one of the peptides has one of the following sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr -Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z,

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

3. A method for detecting the presence of antibody to HIV virus in a sample where the sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to such protein composition to form at least one specific binding pair complex and the amount of complex formation is determined, characterized in that :
 the assay medium comprises a reagent containing a peptide having the following sequence :

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

4. A method according to anyone of claims 1 to 3, wherein said composition is bound to a solid surface.
5. A method according to anyone of claims 1 to 4, wherein said peptide is conjugated to a water-soluble protein of at least 5kDal as said macromolecule.
6. A method according to any one of claims 1 to 5, wherein two of said peptides are covalently linked together through a bond or bridging group.
7. A method for determining the presence of antibodies to HIV in a physiological fluid, said method comprising :
 - combining a human physiological fluid sample with at least one peptide having at least five and fewer than fifty amino acids in a sequence which comes within the sequence of at least one of the following peptide

sequences :

I (126)

5 Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
10 Ala-Thr-Thr-Asp-Ile-X-Z ;

II (123)

15 Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
20 Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

25 Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
30 Glu-Gly-Ala-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or
35 as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

40 Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly ,

- incubating for a sufficient time for complex formation to occur ; and
- 45 - determining the formation of complex by employing a labelled specific binding protein which binds to said complex and provides a detectable signal.

8. A method according to claim 7, wherein one of the peptides has one of the following sequences :

I (126)

50 Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
55 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

9. A method for determining the presence of antibodies to HIV in a physiological fluid, said method comprising : combining a human physiological fluid sample with a peptide having the following sequence :

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
His-Pro-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent; incubating for a sufficient time for complex formation to occur ; and determining the formation of complex by employing a labelled specific binding protein which binds to said complex and provides a detectable signal.

10. A method according to anyone of claims 7 to 9, wherein said label is a fluorescer.

11. A method according to anyone of claims 7 to 9, wherein said label is an enzyme.

12. A vaccine composition comprising at least one peptide selected from the group of peptides having the formulae :

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z ;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and said peptides are conjugated to an immunogenic protein, said peptides or conjugates being present in an amount to provide an immunogenic response in a physiologically acceptable carrier.

13. A vaccine according to claim 12, wherein said peptides are coupled to immunogenic proteins.

14. A peptide of the formula :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ; or

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
 Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
 His-Pro-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

15. The peptide of claim 14, wherein said peptide has formula (I) (126).

16. The peptide of claim 14, wherein said peptide has formula (II) (123).

17. The peptide of claim 14, wherein said peptide has formula (IIa) (124).

18. The peptide of claim 14, wherein said peptide has formula (III) (158).

19. A method of preparing a peptide according to any one of claims 14 to 18, e.g. using an automatic synthesizer or by hybrid or recombinant DNA technology.

20. A method of preparing a vaccine composition according to claim 12 or claim 13 comprising formulating said peptides or conjugates with a physiologically acceptable medium, adjuvant or carrier.

21. A method of preparing a reagent referred to in any one of claims 1 to 11 comprising appropriately formulating said at least one peptide.

Claims for the following Contracting State : ES

1. A method for detecting the presence of antibody to HIV virus in a sample where the sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to such protein composition to form at least one specific binding pair complex and the amount of complex formation is determined, characterized in that :

the assay medium comprises a reagent containing at least one peptide of at least five and fewer than fifty amino acids in a sequence which comes within the sequence of at least one of the following peptide sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

2. A method according to claim 1, wherein one of the peptides has one of the following sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr -Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z,

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

3. A method for detecting the presence of antibody to HIV virus in a sample where the sample is combined with a composition having epitopic sites immunologically competitive with HIV epitopic sites, whereby antibodies bind to such protein composition to form at least one specific binding pair complex and the amount of complex formation is determined, characterized in that :

the assay medium comprises a reagent containing a peptide having the following sequence :

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent.

4. A method according to anyone of claims 1 to 3, wherein said composition is bound to a solid surface.
5. A method according to anyone of claims 1 to 4, wherein said peptide is conjugated to a water-soluble protein of at least 5kDal as said macromolecule.
6. A method according to any one of claims 1 to 5, wherein two of said peptides are covalently linked together through a bond or bridging group.
7. A method for determining the presence of antibodies to HIV in a physiological fluid, said method comprising :
 combining a human physiological fluid sample with at least one peptide having at least five and fewer than fifty amino acids in a sequence which comes within the sequence of at least one of the following peptide sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly,

- incubating for a sufficient time for complex formation to occur ; and
- determining the formation of complex by employing a labelled specific binding protein which binds to said complex and provides a detectable signal.

8. A method according to claim 7, wherein one of the peptides has one of the following sequences :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

or

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptidee or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, provided that said peptide is different from the following peptides :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; and
 Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly .

9. A method for determining the presence of antibodies to HIV in a physiological fluid, said method comprising : combining a human physiological fluid sample with a peptide having the following sequence :

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
 Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
 His-Pro-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent;
 incubating for a sufficient time for complex formation to occur ; and
 determining the formation of complex by employing a labelled specific binding protein which binds to said complex and provides a detectable signal.

10. A method according to anyone of claims 7 to 9, wherein said label is a fluorescer.

11. A method according to anyone of claims 7 to 9, wherein said label is an enzyme.

12. A method of preparing a vaccine composition comprising at least one peptide of peptides having the formulae :

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z ;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides, Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and said peptides are conjugated to an immunogenic protein, said peptides or conjugates being present in an amount to provide an immunogenic response in a physiologically acceptable carrier, said method comprising formulating said peptides or conjugates with a physiologically acceptable medium, adjuvant or carrier.

13. A method of preparing a vaccine according to claim 12, which comprises the coupling of said peptides to immunogenic proteins.

14. A method of preparing a peptide of the formula :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z ; or

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
His-Pro-X-Z ;

wherein X and Y are optionally present and when present represent amino acids that facilitate covalent coupling of said peptide to a protein carrier or other peptides or polymerization through an added cysteine residue by oxidation, and Z indicates that the carboxy terminal amino acid is present as either a free carboxy or as an amide, and where said peptide is free of other peptides or is conjugated to a macromolecule for which antibodies in human sera are substantially absent, said method using an automatic synthesizer or using hybrid or recombinant DNA technology.

15. A method of preparing a reagent referred to in any one of claims 1 to 11 comprising appropriately formulating said at least one peptide.

Patentansprüche

Patentansprüche für folgende Vertragsstaaten : AT, BE, CH, LI, DE, FR, GB, GR, IT, LU, NL, SE

1. Verfahren zur Detektion des Vorliegens von Antikörpern gegen das HIV-Virus in einer Probe, bei welchem die Probe mit einer Zusammensetzung mit epitopen Bereichen, die immunologisch mit epitopen HIV-Bereichen kompetitiv sind, kombiniert wird, wodurch Antikörper an eine derartige Protein-Zusammensetzung binden, um zumindest einen spezifischen Bindungspaar-Komplex zu bilden, und die Menge an Komplexbildung bestimmt wird, dadurch gekennzeichnet, daß:
das Assay-Medium ein Reagenz umfaßt, das zumindest ein Peptid mit zumindest fünf und weniger als fünfzig Aminosäuren in einer Sequenz enthält, die in die Sequenz zumindest einer der folgenden Peptidsequenzen fällt:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 5 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 15 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

oder

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 25 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

30 worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente
 Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen
 angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder
 als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makro-
 35 molekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, mit der Maßgabe, daß das Peptid
 von den folgenden Peptiden verschieden ist:

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; und
 40 Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

2. Verfahren nach Anspruch 1, bei welchem eines der Peptide eine der folgenden Sequenzen aufweist:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 45 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 50 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

oder

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen.

3. Verfahren zur Detektion des Vorliegens von Antikörpern gegen das HIV-Virus in einer Probe, bei welchem die Probe mit einer Zusammensetzung mit epitopen Bereichen, die immunologisch mit epitopen HIV-Bereichen kompetitiv sind, kombiniert wird, wodurch Antikörper an eine derartige Protein-Zusammensetzung binden, um zumindest einen spezifischen Bindungspaar-Komplex zu bilden, und die Menge an Komplexbildung bestimmt wird, dadurch gekennzeichnet, daß:

das Assay-Medium ein Reagenz umfaßt, das ein Peptid mit der folgenden Sequenz enthält:

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z,

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen.

4. Verfahren nach einem der Ansprüche 1 bis 3, bei welchem die Zusammensetzung an eine feste Oberfläche gebunden ist.
5. Verfahren nach einem der Ansprüche 1 bis 4, bei welchem das Peptid an ein wasserlösliches Protein von zumindest 5 kDa als Makromolekül konjugiert ist.
6. Verfahren nach einem der Ansprüche 1 bis 5, bei welchem zwei der Peptide durch eine Bindung oder eine Überbrückungsgruppe kovalent miteinander verbunden sind.
7. Verfahren zur Bestimmung des Vorliegens von Antikörpern gegen HIV in einer physiologischen Flüssigkeit, welches Verfahren umfaßt:

- Kombinieren einer humanen physiologischen Flüssigkeitsprobe mit zumindest einem Peptid mit zumindest fünf und weniger als fünfzig Aminosäuren in einer Sequenz, die in die Sequenz zumindest einer der folgenden Peptidsequenzen fällt:

5

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
10 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Thr-Asp-Ile-X-Z ;

15

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
20 Gly-Glu-Gly-Ala-X-Z ;

oder

25

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
30 Glu-Gly-Ala-X-Z ;

35

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, mit der Maßgabe, daß das Peptid von den folgenden Peptiden verschieden ist:

40

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; und
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly ,

45

- Inkubieren während einer ausreichenden Zeit für das Auftreten einer Komplexbildung; und
- Bestimmen der Komplexbildung unter Verwendung eines markierten spezifischen Bindungsproteins, das an den Komplex bindet und ein detektierbares Signal liefert.

50

8. Verfahren nach Anspruch 7, bei welchem eines der Peptide eine der folgenden Sequenzen aufweist:

55

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

oder

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z,

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, mit der Maßgabe, daß das Peptid von den folgenden Peptiden verschieden ist:

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; und
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly .

9. Verfahren zur Bestimmung des Vorliegens von Antikörpern gegen HIV in einer physiologischen Flüssigkeit, welches Verfahren umfaßt:

- Kombinieren einer humanen physiologischen Flüssigkeitsprobe mit zumindest einem Peptid mit der folgenden Sequenz:

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
His-Pro-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch

einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen;

- Inkubieren während einer ausreichenden Zeit für das Auftreten einer Komplexbildung; und
- Bestimmen der Komplexbildung unter Verwendung eines markierten spezifischen Bindungsproteins, das an den Komplex bindet und ein detektierbares Signal liefert.

10. Verfahren nach einem der Ansprüche 7 bis 9, bei welchem der Marker ein fluoreszierender Marker ist.

11. Verfahren nach einem der Ansprüche 7 bis 9, bei welchem der Marker ein Enzym ist.

12. Impfstoff-Zusammensetzung, welche zumindest ein Peptid umfaßt, ausgewählt aus der Gruppe von Peptiden der Formeln:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z ;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z ;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei die Peptide an ein immunogenes Protein konjugiert sind, welche Peptide oder Konjugate in einer Menge vorliegen, um eine immunogene Reaktion in einem physiologisch annehmbaren Träger vorzusehen.

13. Impfstoff nach Anspruch 12, worin die Peptide mit immunogenen Proteinen gekoppelt sind.

14. Peptid der Formel:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

oder

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
 Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
 His-Pro-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen.

15. Peptid nach Anspruch 14, wobei das Peptid die Formel (I) (126) aufweist.

16. Peptid nach Anspruch 14, wobei das Peptid die Formel (II) (123) aufweist.

17. Peptid nach Anspruch 14, wobei das Peptid die Formel (IIa) (124) aufweist.

18. Peptid nach Anspruch 14, wobei das Peptid die Formel (III) (158) aufweist.

19. Verfahren zur Herstellung eines Peptids nach einem der Ansprüche 14 bis 18, z.B. unter Verwendung eines automatischen Synthesizers oder durch hybride oder rekombinanten DNS-Technologie.

20. Verfahren zur Herstellung einer Impfstoff-Zusammensetzung nach Anspruch 12 oder 13, welches das Formulieren der Peptide oder Konjugate mit einem physiologisch annehmbaren Medium, Adjuvans oder Träger umfaßt.

21. Verfahren zur Herstellung eines Reagenz, auf das in einem der Ansprüche 1 bis 11 bezuggenommen wird, welches

das geeignete Formulieren des zumindest einen Peptids umfaßt.

Patentansprüche für folgenden Vertragsstaat : ES

1. Verfahren zur Detektion des Vorliegens von Antikörpern gegen das HIV-Virus in einer Probe, bei welchem die Probe mit einer Zusammensetzung mit epitopen Bereichen, die immunologisch mit epitopen HIV-Bereichen kompetitiv sind, kombiniert wird, wodurch Antikörper an eine derartige Protein-Zusammensetzung binden, um zumindest einen spezifischen Bindungspaar-Komplex zu bilden, und die Menge an Komplexbildung bestimmt wird, dadurch gekennzeichnet, daß:
- das Assay-Medium ein Reagenz umfaßt, das zumindest ein Peptid mit zumindest fünf und weniger als fünfzig Aminosäuren in einer Sequenz enthält, die in die Sequenz zumindest einer der folgenden Peptidsequenzen fällt:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen.

3. Verfahren zur Detektion des Vorliegens von Antikörpern gegen das HIV-Virus in einer Probe, bei welchem die Probe mit einer Zusammensetzung mit epitopen Bereichen, die immunologisch mit epitopen HIV-Bereichen kompetitiv sind, kombiniert wird, wodurch Antikörper an eine derartige Protein-Zusammensetzung binden, um zumindest einen spezifischen Bindungspaar-Komplex zu bilden, und die Menge an Komplexbildung bestimmt wird, dadurch gekennzeichnet, daß:

das Assay-Medium ein Reagenz umfaßt, das ein Peptid mit der folgenden Sequenz enthält:

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen.

4. Verfahren nach einem der Ansprüche 1 bis 3, bei welchem die Zusammensetzung an eine feste Oberfläche gebunden ist.

5. Verfahren nach einem der Ansprüche 1 bis 4, bei welchem das Peptid an ein wasserlösliches Protein von zumindest 5 kDa als Makromolekül konjugiert ist.
6. Verfahren nach einem der Ansprüche 1 bis 5, bei welchem zwei der Peptide durch eine Bindung oder eine Überbrückungsgruppe kovalent miteinander verbunden sind.
7. Verfahren zur Bestimmung des Vorliegens von Antikörpern gegen HIV in einer physiologischen Flüssigkeit, welches Verfahren umfaßt:
- Kombinieren einer humanen physiologischen Flüssigkeitsprobe mit zumindest einem Peptid mit zumindest fünf und weniger als fünfzig Aminosäuren in einer Sequenz, die in die Sequenz zumindest einer der folgenden Peptidsequenzen fällt:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

oder

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, mit der Maßgabe, daß das Peptid von den folgenden Peptiden verschieden ist:

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; und
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly,

- Inkubieren während einer ausreichenden Zeit für das Auftreten einer Komplexbildung; und
 - Bestimmen der Komplexbildung unter Verwendung eines markierten spezifischen Bindungsproteins, das an den Komplex bindet und ein detektierbares Signal liefert.
8. Verfahren nach Anspruch 7, bei welchem eines der Peptide eine der folgenden Sequenzen aufweist:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

oder

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, mit der Maßgabe, daß das Peptid von den folgenden Peptiden verschieden ist:

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; und
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly .

9. Verfahren zur Bestimmung des Vorliegens von Antikörpern gegen HIV in einer physiologischen Flüssigkeit, welches Verfahren umfaßt:

- Kombinieren einer humanen physiologischen Flüssigkeitsprobe mit zumindest einem Peptid mit der folgenden Sequenz:

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
His-Pro-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch

einen angefügten Cysteinrest mittels Oxidation erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen;

- Inkubieren während einer ausreichenden Zeit für das Auftreten einer Komplexbildung; und
- Bestimmen der Komplexbildung unter Verwendung eines markierten spezifischen Bindungsproteins, das an den Komplex bindet und ein detektierbares Signal liefert.

10. Verfahren nach einem der Ansprüche 7 bis 9, bei welchem der Marker ein fluoreszierender Marker ist.

11. Verfahren nach einem der Ansprüche 7 bis 9, bei welchem der Marker ein Enzym ist.

12. Verfahren zur Herstellung einer Impfstoff-Zusammensetzung, die zumindest ein Peptid von Peptiden der Formeln umfaßt:

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-His-Pro-X-Z ;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-Ala-Thr-Asp-Ile-X-Z ;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-Glu-Gly-Ala-X-Z ;

worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden erleichtern, Z anzeigt, daß die Carboxy-terminale Aminosäure entweder als freies Carboxy oder als Amid vorliegt, und wobei die Peptide an ein immunogenes Protein konjugiert sind, welche Peptide oder Konjugate in einer Menge vorliegen, um eine immunogene Reaktion in einem physiologisch annehmbaren Träger vorzusehen; welches Verfahren das Formulieren der Peptide oder Konjugate mit einem physiologisch annehmbaren Medium, Adjuvans oder Träger umfaßt.

13. Verfahren zur Herstellung eines Impfstoffs nach Anspruch 12, welches das Koppeln der Peptide mit immunogenen Proteinen umfaßt.

14. Verfahren zur Herstellung eines Peptids der Formel:

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 5 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

10

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 15 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

20

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 25 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ;

30 oder

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-Leu-
 35 Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-Val-
 His-Pro-X-Z ;

40 worin X und Y gegebenenfalls vorhanden sind und, sofern vorhanden, Aminosäuren darstellen, die eine kovalente
 Kopplung des Peptids mit einem Protein-Träger oder anderen Peptiden oder eine Polymerisation durch einen
 angefügten Cysteinrest mittels Oxidation erleichtern, und Z anzeigt, daß die Carboxy-terminale Aminosäure ent-
 weder als freies Carboxy oder als Amid vorliegt, und wobei das Peptid frei ist von anderen Peptiden oder an ein
 45 Makromolekül konjugiert ist, für das Antikörper in Humansera im wesentlichen fehlen, bei welchem Verfahren ein
 automatisches Synthesizer verwendet wird oder hybride oder rekombinante DNS-Technologie verwendet wird.

15. Verfahren zur Herstellung eines Reagenz, auf das in einem der Ansprüche 1 bis 11 bezuggenommen wird, welches
 das geeignete Formulieren des zumindest einen Peptids umfaßt.

50

Revendications

Revendications pour les Etats contractants suivants : AT, BE, CH, LI, DE, FR, GB, GR, IT, LU, NL, SE

55

1. Procédé de détection de la présence d'un anticorps dirigé contre le virus VIH dans un échantillon, où l'échantillon
 est combiné à une composition ayant des sites épitopiques immunologiquement compétitifs avec des sites épito-
 piques du VIH, les anticorps se liant à cette composition protéique pour former au moins un complexe à paire à

liaison spécifique et la quantité de complexe formé étant déterminée, caractérisé en ce que :

le milieu de dosage comprend un réactif contenant au moins un peptide ayant au moins cinq acides aminés et moins de cinquante acides aminés dans une séquence qui se trouve à l'intérieur de la séquence d'au moins une des séquences peptidiques suivantes :

5

I (126)

10

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

15

II (123)

20

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

25

ou

IIa (124)

30

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

35

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

40

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

45

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

2. Procédé selon la revendication 1, où un des peptides a une des séquences suivantes :

50

55

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 5 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

10

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 15 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

20

ou

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 25 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z.

30

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

35 et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain.

3. Procédé de détection de la présence d'un anticorps dirigé contre le virus VIH dans un échantillon, où l'échantillon est combiné à une composition ayant des sites épitopiques immunologiquement compétitifs avec des sites épito-
 40 piques du VIH, les anticorps se liant à cette composition protéique pour former au moins un complexe à paire à liaison spécifique et la quantité de complexe formé étant déterminée, caractérisé en ce que :

le milieu de dosage comprend un réactif contenant un peptide ayant la séquence suivante :

45

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-
 50 Arg-Val-His-Pro-X-Z

50

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

55

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain.

4. Procédé selon l'une quelconque des revendications 1 à 3, ladite composition étant liée à une surface solide.
5. Procédé selon l'une quelconque des revendications 1 à 4, ledit peptide étant conjugué à une protéine hydrosoluble d'au moins 5 kDa en tant que dite macromolécule.
6. Procédé selon l'une quelconque des revendications 1 à 5, deux desdits peptides étant mutuellement liés par covalence par une liaison ou un groupe formant un pont.
7. Procédé de détermination de la présence d'anticorps dirigés contre le VIH dans un liquide physiologique, ledit procédé comprenant :
 - la combinaison d'un échantillon de liquide physiologique humain avec au moins un peptide ayant au moins cinq acides aminés et moins de cinquante acides aminés dans une séquence qui se trouve à l'intérieur de la séquence d'au moins une des séquences peptidiques suivantes :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

ou

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide
 et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
 Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly,

- une incubation pendant une durée suffisante pour que survienne la formation d'un complexe ; et
- la détermination de la formation du complexe par recours à une protéine marquée à liaison spécifique qui se lie audit complexe et produit un signal détectable.

5 8. Procédé selon la revendication 7, où un des peptides a une des séquences suivantes :

I (126)

10 Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

15

II (123)

20 Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

25 ou

IIa (124)

30 Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

35 où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide
40 et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

45 Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

50 9. Procédé de détermination de la présence d'anticorps dirigés contre le VIH dans un liquide physiologique, ledit procédé comprenant :

- la combinaison d'un échantillon de liquide physiologique humain avec un peptide ayant la séquence suivante :

55

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain ;

- une incubation pendant une durée suffisante pour que survienne la formation d'un complexe ; et
- la détermination de la formation du complexe par recours à une protéine marquée à liaison spécifique qui se lie audit complexe et produit un signal détectable.

10. Procédé selon l'une quelconque des revendications 7 à 9, où ledit marqueur est une substance fluorescente.

11. Procédé selon l'une quelconque des revendications 7 à 9, où ledit marqueur est une enzyme.

12. Composition vaccinale comprenant au moins un peptide sélectionné dans le groupe de peptides de formules :

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z ;

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-
 Gly-Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-
 Ile-Ile-Ala-Thr-Asp-Ile-X-Z ;

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides, Z indique que l'acide aminé

carboxyle terminal est présent soit sous la forme d'un carboxyle libre, soit sous la forme d'un amide et lesdits peptides sont conjugués à une protéine immunogène, lesdits peptides ou conjugués étant présents en une quantité apte à fournir une réponse immunogène dans un support physiologiquement acceptable.

5 13. Vaccin selon la revendication 12, où lesdits peptides sont couplés à des protéines immunogènes.

14. Peptide de formule :

10

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
15 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

20

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
25 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

30

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
35 Glu-Gly-Ala-X-Z ; ou

40

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
45 Val-His-Pro-X-Z ;

50

où X' et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain.

55

15. Peptide selon la revendication 14, ledit peptide ayant la formule (I) (126).

16. Peptide selon la revendication 14, ledit peptide ayant la formule (II) (123).

17. Peptide selon la revendication 14, ledit peptide ayant la formule (IIa) (124).
18. Peptide selon la revendication 14, ledit peptide ayant la formule (III) (158).
- 5 19. Procédé de préparation d'un peptide selon l'une quelconque des revendications 14 à 18, par exemple par utilisation d'un synthétiseur automatique ou par des techniques d'hybridation ou de recombinaisons génétiques.
20. Procédé de préparation d'une composition vaccinale selon la revendication 12 ou la revendication 13, comprenant la formulation desdits peptides ou conjugués avec un milieu, adjuvant ou support physiologiquement acceptable.
- 10 21. Procédé de préparation d'un réactif selon l'une quelconque des revendications 1 à 11, comprenant la formulation appropriée dudit au moins un peptide.

15 **Revendications pour l'Etat contractant suivant : ES**

1. Procédé de détection de la présence d'un anticorps dirigé contre le virus VIH dans un échantillon, où l'échantillon est combiné une composition ayant des sites épitopiques immunologiquement compétitifs avec des sites épitopiques du VIH, les anticorps se liant à cette composition protéique pour former au moins un complexe à paire à liaison spécifique et la quantité de complexe formé étant déterminée, caractérisé en ce que :
 20 le milieu de dosage comprend un réactif contenant au moins un peptide ayant au moins cinq acides aminés et moins de cinquante acides aminés dans une séquence qui se trouve à l'intérieur de la séquence d'au moins une des séquences peptidiques suivantes :

25

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 30 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

35

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 40 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

45

ou

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 50 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

55

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme

d'un carboxyle libre ou d'un amide

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

2. Procédé selon la revendication 1, où un des peptides a une des séquences suivantes :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

ou

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z.

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain.

3. Procédé de détection de la présence d'un anticorps dirigé contre le virus VIH dans un échantillon, où l'échantillon est combiné à une composition ayant des sites épitopiques immunologiquement compétitifs avec des sites épitopiques du VIH, les anticorps se liant à cette composition protéique pour former au moins un complexe à paire à liaison spécifique et la quantité de complexe formé étant déterminée, caractérisé en ce que :

le milieu de dosage comprend un réactif contenant un peptide ayant la séquence suivante :

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-
 Arg-Val-His-Pro-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain.

4. Procédé selon l'une quelconque des revendications 1 à 3, ladite composition étant liée à une surface solide.
5. Procédé selon l'une quelconque des revendications 1 à 4, ledit peptide étant conjugué à une protéine hydrosoluble d'au moins 5 kDa en tant que dite macromolécule.
6. Procédé selon l'une quelconque des revendications 1 à 5, deux desdits peptides étant mutuellement liés par covalence par une liaison ou un groupe formant un pont.
7. Procédé de détermination de la présence d'anticorps dirigés contre le VIH dans un liquide physiologique, ledit procédé comprenant :
 - la combinaison d'un échantillon de liquide physiologique humain avec au moins un peptide ayant au moins cinq acides aminés et moins de cinquante acides aminés dans une séquence qui se trouve à l'intérieur de la séquence d'au moins une des séquences peptidiques suivantes :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

ou

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly,

- une incubation pendant une durée suffisante pour que survienne la formation d'un complexe ; et
- la détermination de la formation du complexe par recours à une protéine marquée à liaison spécifique qui se lie audit complexe et produit un signal détectable.

8. Procédé selon la revendication 7, où un des peptides a une des séquences suivantes :

20

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

30

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
Gly-Glu-Gly-Ala-X-Z ;

ou

40

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
Glu-Gly-Ala-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain, pour autant que ledit peptide soit différent des peptides suivants :

55

Val-Tyr-Tyr-Arg-Asp-Ser-Arg-Asn-Pro-Leu ; et
Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly.

5

9. Procédé de détermination de la présence d'anticorps dirigés contre le VIH dans un liquide physiologique, ledit procédé comprenant :

10 - la combinaison d'un échantillon de liquide physiologique humain avec un peptide ayant la séquence suivante :

III (158)

15

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
Val-His-Pro-X-Z

20

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par oxydation via un résidu cystéine ajouté, Z indique que l'acide aminé carboxyle terminal est présent sous la forme d'un carboxyle libre ou d'un amide

25

et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe sensiblement pas d'anticorps dans le sérum humain ;

- une incubation pendant une durée suffisante pour que survienne la formation d'un complexe ; et
- la détermination de la formation du complexe par recours à une protéine marquée à liaison spécifique qui se lie audit complexe et produit un signal détectable.

30

10. Procédé selon l'une quelconque des revendications 7 à 9, où ledit marqueur est une substance fluorescente.

11. Procédé selon l'une quelconque des revendications 7 à 9, où ledit marqueur est une enzyme.

35

12. Procédé de préparation d'une composition vaccinale comprenant au moins un peptide de peptides ayant les formules :

40

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
Val-His-Pro-X-Z ;

45

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
Ala-Thr-Asp-Ile-X-Z ;

50

55

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z

où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides, Z indique que l'acide aminé carboxyle terminal est présent soit sous la forme d'un carboxyle libre, soit sous la forme d'un amide et lesdits peptides sont conjugués à une protéine immunogène, lesdits peptides ou conjugués étant présents en une quantité apte à fournir une réponse immunogène dans un support physiologiquement acceptable, ledit procédé comprenant la formulation desdits peptides ou conjugués avec un milieu, adjuvant ou support physiologiquement acceptable.

13. Procédé de préparation d'un vaccin selon la revendication 12, lequel comprend le couplage desdits peptides à des protéines immunogènes.

14. Procédé de préparation d'un peptide de formule :

I (126)

Y-Gln-Val-Arg-Asp-Gln-Ala-Glu-His-Leu-Lys-Thr-Ala-Val-
 Gln-Met-Ala-Val-Phe-Ile-His-Asn-Phe-Lys-Arg-Lys-Gly-Gly-
 Ile-Gly-Gly-Tyr-Ser-Ala-Gly-Glu-Arg-Ile-Val-Asp-Ile-Ile-
 Ala-Thr-Asp-Ile-X-Z ;

II (123)

Y-Ile-Ala-Thr-Asp-Ile-Gln-Thr-Lys-Glu-Leu-Gln-Lys-Gln-
 Ile-Thr-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-
 Arg-Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-
 Gly-Glu-Gly-Ala-X-Z ;

IIa (124)

Y-Lys-Ile-Gln-Asn-Phe-Arg-Val-Tyr-Tyr-Arg-Asp-Ser-Arg-
 Asp-Pro-Leu-Trp-Lys-Gly-Pro-Ala-Lys-Leu-Leu-Trp-Lys-Gly-
 Glu-Gly-Ala-X-Z ; ou

III (158)

Y-Leu-Asn-Thr-Val-Gly-Gly-His-Gln-Ala-Ala-Met-Gln-Met-
 5 Leu-Lys-Glu-Thr-Ile-Asn-Glu-Glu-Ala-Ala-Glu-Trp-Asp-Arg-
 Val-His-Pro-X-Z ;

10 où X et Y sont facultativement présents et, lorsqu'ils sont présents, représentent des acides aminés qui facilitent
 le couplage par covalence dudit peptide à un support protéique ou à d'autres peptides ou la polymérisation par
 oxydation via un résidu cystéine ajouté et Z indique que l'acide aminé carboxyle terminal est présent sous la forme
 d'un carboxyle libre ou d'un amide
 15 et où ledit peptide est exempt d'autres peptides ou est conjugué à une macromolécule pour laquelle il n'existe
 sensiblement pas d'anticorps dans le sérum humain, ledit procédé utilisant un synthétiseur automatique ou des
 techniques d'hybridation ou de recombinaisons génétiques.

15. Procédé de préparation d'un réactif selon l'une quelconque des revendications 1 à 11, comprenant la formulation
 appropriée dudit au moins un peptide.
